1. Overview of the User Journey

This map outlines the path Rajesh takes when interacting with the OptiCrop system, from soil sampling to harvesting, highlighting key actions, touchpoints, pain points, and system opportunities:

Phase	Actions	Touchpoints	Pain Points	System Opportunities
1. Sampling	Collects soil, obtains NPK & pH values	Local testing lab	Slow lab reports, manual recording	Provide guidance on how to sample soil
2. Accessing	Navigates to OptiCrop portal, logs in	Web Portal / App	Unstable network, authentication issues	Optimize for low bandwidth, implement offline mode
3. Input	Inputs N, P, K, pH, temp, rainfall	Optimization Form	Form confusion, units mismatch	Add input validation and default values
4. Predict	Submits inputs, gets crop recommendations & yield.	Results Page	Slow calculations, complex data	Provide instant visual indicators and trends
5. Actions	Applies prescribed fertilizers, plants crop	Fertilizer Application	Lack of step-by-step guidance	Generate clear NPK corrective instructions
6. Harvest	Grows crop, records final harvest yield	Yield Log	Manual data entry, lack of incentives	Automate harvest results to update model
